### Fundamentals of Asset tokenisation (1/4)

### **Purpose of Asset Tokenisation**

Web3 is an extremely diverse sector and its applications have adapted to the world around it in ways that offer specific benefits exclusive to the technology. Through Decentralised Finance, the Metaverse, Decentralised Autonomous Organisations, Blockchain-based Gaming, social media Dapps, and NFT collections, Web3 has greatly expanded its scope to blur the boundaries among sectors and showcase a truly revolutionary toolkit capable of enhancing operations across industries.

Asset tokenisation is one of the marquee applications of Web3 and blockchain which has potential to transform asset ownership through digitisation distributed ledger. Asset tokenisation refers to the process of converting a real world physical or digital asset into a digital token which represents the asset, either completely or fractionally, on a blockchain. Anything with inherent value in monetary terms including tangible assets like gold, real estate, and art and intangible assets such as equity, funds, patents, trademarks, and more can be converted into a digital token.

The process of tokenising an asset begins with identifying the asset (land, shares, and so on). After the user verifies the ownership of an asset, the value of the asset is ascertained based on the prevailing market conditions. The units of division are then specified. For example, a real estate plot valued at USD 1 Million may be broken down into one thousand tokens with each representing a USD 1,000 value of the asset. Smart contracts, on the basis of which the logic of the sale is implemented, are then developed with the help of a third party platform such as SoluLab, ADDX, or any others and the blockchain on which the created tokens will be recorded is selected and the smart contract is implemented. The asset then goes on sale through an app where users can buy the tokens issued.

Asset tokenisation frameworks may be based on existing standards such as those issued by Ethereum for its blockchain to ensure smooth operations and interoperability. Some widely used standards on Ethereum include ERC-20 for fungible tokens and ERC-721 for Non-Fungible Tokens (NFTs).

### Fundamentals of Asset tokenisation (2/4)

### The Benefits of Asset Tokenisation

Once the asset is tokenized, the value of the asset can be fractionalised into smaller parts, each of which can be individually managed, stored, traded, and sold based on the predetermined value. The process is a defining representation of the possibilities the underlying infrastructure encapsulates but the benefits extend beyond the technical achievement as there are unique benefits to tokenising an asset.

accessibility. As the requirement to invest in a given asset, and by extension a given market is reduced to its minimum threshold, the capital required for an individual who wishes to enter into the tokenised real-estate market, for example, decreases. This greatly expands the size of the market by lowering barriers of entry.

The second benefit is increased market

The first and most obvious benefit is the ability to buy and sell fractions of an asset. Tokenisation allows for an asset to be divided into several "micro-assets" which are independent of each other and functionally the same as the larger whole. This facilitates greater liquidity as the seller does not have to find one single buyer for the asset and the buyer does not need the entire amount required to purchase the asset. This makes the process of finding a buyer or a seller for a aiven asset significantly easier.

Asset tokenisation also facilitates immutability and transparency. Once the data is recorded and stored on a blockchain, it cannot be altered or deleted. The record of ownership and maintenance of an asset recorded onchain is thus verifiably accurate. Depending on the smart contract logic, the recorded information can also be conveniently accessed by the stakeholders involved in a transaction. This makes the whole process more transparent and reliable and minimises scope for malpractices and malfeasance.

Smart contracts also allow the end-to-end process to be automated, thereby cutting down administrative efforts required. This eliminates the requirement of intermediaries and results in cost-effective, streamlined, and faster mechanisms.

### Fundamentals of Asset tokenisation (3/4)

### Economic Potential for Asset Tokenisation

These reasons make Asset Tokenisation an extremely attractive proposition consequently, the interest in asset tokenisation is at an all time high. A report by the Citi Group<sup>[1]</sup> dubbed it the 'killer use-case' of blockchain and forecasted that the market would be valued at USD 5 trillion by 2030 with tokenised value of real estate assets at USD 1.5 trillion and private equity and venture capital at USD 700 billion. Through a report by BCG<sup>[2]</sup>, some experts predict that the valuation of tokenized global illiquid assets alone could grow to over \$16 trillion and account for roughly 10% of global GDP. A survey conducted by EY Parthenon[3] found that 37% of Institutional Investors and 61% of HNIs plan to invest in tokenised assets by 2024. 63% of institutional and 59% of HNW investors ranked private equity as the first preference of asset and real estate a close second. In a record deal, Inveniam Capital Partners, a New York based private equity firm, announced plans to tokenise four private real estate and debt transactions, jointly valued at USD 260 million.[4]

In September 2023, The International Financial Services Centres Authority (IFSCA) formed a seven-member committee of experts to develop regulations and policy guidelines for tokenisation of real-world assets.<sup>[5]</sup>

It is also gaining momentum in the Indian context. In July 2023, Telangana government announced plans to launch its Asset Tokenisation Standards Framework aimed at providing a common set of rules and quidelines for the tokenisation of assets in India.<sup>[5]</sup> The framework is being developed in collaboration with sector partners including the Bharat Web3 Association. In May 2023, Small Industries Development Bank of India announced the completion of its pilot project exploring tokenisation undertaken in collaboration with Infosys. [6] There is great potential for the technology to prosper in India. Real estate tokenisation, a tentpole for the process, can take off in the country which has historically invested generously in the Real estate sector, the country's biggest market after agriculture.

However, this potential and possible future progress still faces a lot of challenges on the road ahead. There is still ambiguity with respect to legality surrounding Web3, VDAs, and blockchain in India. This makes it difficult for large investors to participate in the market because of the implied uncertainty.

### Fundamentals of Asset tokenisation (4/4)

### **Future Outlook for India**

Tax treatment of VDAs in India is also a major concern because of its implications on the tokenisation sector. When dealing with assets worth millions of dollars, Investors might find the Indian taxation outlook to repulsive and choose to find avenues elsewhere as global tokenisation structures evolve.

Positive signs have emerged in the recent past however, which may indicate that things will change in the future. The recently released IMF-FSB Synthesis paper, developed through directions from the Indian G20 presidency, includes asset tokenisation framework in its scope and ambit of its implementation roadmap, according to which, the FSB will undertake a global market analysis to achieve regulatory clarity and identify changes which may be needed from a policy perspective. The planned study will go on until 2024, following which subsequent measures may be taken to expand on the market.

These developments may facilitate growth of the sector in the next year and a half until FSB completes its study, so that the Indian sector remains ready to step up when the opportunity arrives.

# **Monthly Recap**

Noteworthy Activities of the Association (1/3)

### **BWA x RCAT Workshop**

28th Sep 2023

### Namaste Web3 in Indore 23rd Sep 2023

iStart Rajasthan conducted an Awareness Workshop on Web3 with the objective of educating the startup ecosystem on Web3. The Workshop took place on 28th September 2023 at the Techno Hub in Jaipur from 11:30 AM to 1:30 PM.

Addressing the gathering at the iStart Web3 Masterclass, BWA Chairman Dilip Chenoy spoke about the immense potential of Web3 to shape the future of Indian Tech and Economy, emphasising the role of domestic start-ups in helping the country realize its potential to become one of the highest growth markets for Web3 globally.

#### **Read More**

As part of the panel on Web3 and Entrepreneurship, at the Namaste Web3 event held in Indore on 23rd September, Mr Dilip Chenoy spoke about India's potential to become a significant player in the Web3 industry, the major challenges currently faced by Indian entrepreneurs and the potential collaborations needed to realize the country's potential as a leader in the Web3 space.

He talked about how, to bring 1 billion users to Web3, developers must skillfully craft their innovations to align with the unique needs of various sectors and thus by concentrating on what truly matters to industries and individuals alike, entrepreneurs can bridge the gap between cutting-edge technology and practical application, ensuring that innovation resonates with real-world requirements.

# **Monthly Recap**

Noteworthy Activities of the Association (2/3)

### AVGC-XR Policy 2023 22nd Sep 2023

# Webinar with T-Hub 13th Sep 2023

BWA Chairperson, Shri Dilip Chenoy, participated in the Stakeholder Consultation Workshop organized by the Electronics Corporation of Tamil Nadu Limited (ELCOT), Government of Tamil Nadu on the AVGC-XR Policy 2023 in Chennai. He was part of a panel titled "Bridging the Demand-Supply Talent Gap (Quality and Quantity)".

Speaking at the roundtable, he said that though Web3 and AVGC are a cross-disciplinary collaboration, there are a host of skills in the AVGC sector, such as 3D modeling, animation, and digital artistry, which can be directly applied to Web3 technologies, particularly in the creation of NFTs and other blockchain-based gaming assets. This collaboration could lead to innovation projects and therefore he suggested that adequate training is required to support growth.

### **Monthly Recap**

Noteworthy Activities of the Association (3/3)

### **Apiary's Virtual Roadshow** 4th Sep 2023

### Transforming Public Utilities 1st Sep 2023

Together, Apiary and STPI have launched the Idea Challenge Programme (ICP) 4.0 to identify & support potential cutting-edge IT entrepreneurs especially in the field of Blockchain and as a part of the ICP 4.0 Apiary hosted a virtual roadshow with sector experts as panellists for startups across the country.

The Conference on Transforming Public Utilities: Blockchain Use-Cases over Digital Infrastructure Aligning G20 Agenda brought together experts, professionals, and stakeholders from various fields to delve into the transformative potential of blockchain technology in the realm of public utilities.

Speaking on the Topic 'The Business Case for Our Chairperson Mr. Dilip Chenoy moderated the Blockchain in the Enterprise', the BWA Chairperson spoke about the potential of IT entrepreneurs to significantly contribute towards product development, job creation and enhancing the economic health of the country.

session on "Transforming Public Utilities: Blockchain Use Cases over Digital Infrastructure" which focused on "Skilling and Capacity Building in Blockchain and and innovative "Blockchain-based Solutions for Telecom Security."

Shilpi Kulshrestha Founder BusinezExcellence

### BWA welcomes a new affiliate partner to the Association!

Shilpi Kulshrestha founded BusinezExcellence in 2020 to cater to tech-based companies' day legal consulting needs, including Crypto, blockchain, Web3, gaming, SaaS, IoT and Engineering. She is a lawyer by profession and is currently focusing on the VDA ecosystem and related laws and policies like PMLA, AML, PEP. She is extremely passionate about the sector and BWA is thrilled to have her onboard.

### The IMF-FSB Synthesis Paper (1/5)

### Part 1: Overview and Context

The IMF-FSB Synthesis Paper comprehensive document which identifies emerging risks in the Virtual Digital Assets (VDAs) sector, highlights their impact and implications on the sector and economies at large, and finally proposes recommendation for a targeted remedial roadmap, for which it also proposes a plan of action with timelines for implementation.

The paper traces the journey of VDAs since their introduction and mentions the volatility of VDAs over the years. It describes how VDA related activities have grown in complexity which has increased the interconnectedness of the entire market but also notes that the impact of the VDA market on other traditional financial markets has been very limited. It discourages blanket bans, deeming their and implementation costly technically demanding, and underlines how such bans, because of the borderless nature of VDAs, increase circumvention, may thereby heightening financial integrity risks. Since it is synthesis paper, there are no new recommendations in it apart from the ones already published by the IMF, FSB, and other Standard Setting Bodies. Its objective is to integrate all such publications into one comprehensive framework for alobal regulation which addresses various dimensions of regulation.

The paper highlights how risks and implications of VDAs and their proliferation may intersect and how emergence of one risk, such as financial instability, can have a compounded effect on another, such as maintaining price stability.

The scope of the paper includes a wide range of VDAs, including tokens, stablecoins, and DeFi. It follows the same principle of 'same activity, same risk, same regulation' as the FSB's previous papers aimed at providing global regulation guidelines.

### **Setting the Tone**

Throughout the paper, the IMF and FSB continuously emphasise the importance of global cooperation and collaboration considering the borderless nature of technology. The fact that the implications and risks associated with VDAs may be more magnified in EMDEs, defined by weaker monetary frameworks, larger share of unbanked population, lesser degree of financial education and higher cross border transaction costs, is also repeatedly mentioned and the paper therefore suggests that, in addition to the proposed recommendations, such EMDEs adopt a targeted and region-specific approach to address these elevated macrofinancial risks.

### The IMF-FSB Synthesis Paper (2/5)

### Part 2: Diagnoses and Remedies

The bulk of the paper systematically identifies the various implications and the consequent emerging risks associated with VDAs and their widespread adoption and proposes individual, specific recommendations to address each of them.

The implications are divided into three broad groups:

- 1. Macroeconomic Stability
- The impact of widespread adoption of VDAs on the effectiveness of monetary policies around the world: The paper discusses the implications of "cryptoization" or currency substitution.
   Since VDAs such as stablecoins may be pegged to a foreign currency over which central banks have little authority, these banks may be unable to exercise controls on such assets.
- The fiscal risks which emerge due to exposure of conventional financial markets to VDAs: Such risks emerge because of ambiguous tax regimes, cross-border nature of VDAs, and overreliance on self-reporting and voluntary compliance and include exchange-rate risks, contingent liabilities, and risks to public finances.

- Rapid capital outflows and diversion of foreign investments: If it becomes relatively cheaper and easier to hold VDAs when compared to foreign currency bank accounts, investors may choose to invest in the former which may lead to outflow of foreign capital which could have been invested domestically.
- Impact on the Global Financial Safety Net Payment system fraamentation: Widespread adoption of VDAs could require changes to the Global Financial Safety Net, an element of the IMF's International Monetary System developed provide financial assistance stability to countries facing financial crises or systemic risks. Moreover, adoption of stablecoins as a standard mode payment may cause fragmentation of payment systems and result in fragmented liquidity.

To address these concerns, the paper proposes the following policy responses:

i. Safeguard monetary sovereignty and stability: The paper reinforces the idea that developing an effective framework is the best way to protect monetary sovereignty and address weak monetary policy frameworks. The framework should be transparent, coherent, and consistent.

### The IMF-FSB Synthesis Paper (3/5)

### Part 2: Diagnoses and Remedies

ii. Guard against excessive capital flow volatility: Jurisdictions should clarify the legal status of VDAs and amend CFM laws to accommodate VDAs. Authorities should also develop measures which address data gaps to monitor risks more effectively.

Address fiscal iii. risks and adopt unambiguous tax treatment: Fiscal risks which emerge due to adoption of VDAs must be identified and a government's exposure to such risks must be quantified and monitored to enhance the government's ability to address and mitigate them. Additionally, tax policies should be clear in their treatment of VDAs and tax authorities should strengthen compliance efforts, including institutional capacity, investing in specialised data infrastructure, training administration staff, among others.

iv. Monitor the impact of VDAs on the International Monetary System: To address the challenges presented by increased fragmentation, volatile capital outflows, and new risks to financial stability, the IMF should monitor impact of VDAs on cross-border capital outflows, effects of exchange-rate and capital account regimes, financial integrity risks, and demand for and supply of GFSN resources and use its assessment to inform policymaking around the world.

Financial Stability Implications and regulatory issues

Many risks related to VDA markets overlap those associated with traditional financial markets including vulnerabilities related to leverage, liquidity and maturity mismatch. operational and technical fragilities, and market interconnectedness. Emerging risks caused by possible exposures of traditional financial markets to VDAs can result in threats to global financial stability if, due to market disruptions, VDA investors sell their traditional financial assets to maintain liquidity or retail investors curtail spending or reduce their investments in other assets.

To resolve these issues, the recommendations prescribe the adoption of the FSB's proposed Global Framework for Crypto Asset Activities for VDAs and Global Stablecoin Arrangements.

The recommendations broadly prescribe that:

- Authorities must oversee crypto asset and stablecoin activities, tailoring regulations to regional business contexts.
- They should leverage existing cooperation mechanisms and establish new ones for cross-sectoral and cross-border activities.

### The IMF-FSB Synthesis Paper (4/5)

### Part 2: Diagnoses and Remedies

- Virtual Asset Service Providers (VASPs)
  must implement robust governance and
  risk management frameworks, with clear
  accountability.
- VASPs should maintain databases for regulatory oversight and furnish stakeholders with transparent information.
- Guidelines should specifically address each function of VASPs with multiple roles.

These measures should be adopted by relevant authorities with additional targeted measures as necessitated by the regional market conditions.

#### 3. Other Risks

These include other tangible risks like those emerging from the varying legal treatment of VDAs across jurisdictions, weak and inconsistent implementation of AML/CFT requirements, non-compliance with or lack of regulation for Virtual Digital Asset Activities, and environmental risks.

To address legal concerns, jurisdictional authorities should clarify the application of existing laws and assess the need for new ones with support from the private sector and in line with private sector involvement. Amendments are suggested to existing laws to cover any gaps.

The paper advocates for the adoption of unambiguous, transparent, and predictable tax frameworks and international cooperation to mitigate problems related to under-assessing and under-collecting of tax to insulate public finances.

To curb terrorist financing and money laundering, jurisdictions should implement FATF's Guidance for a Risk-Based Approach to Virtual Assets and Virtual Asset Service Providers, which prescribes relevant authorities to license VASPs and supervise the sector in the same way they supervise other financial institutions, and VASPs to implement risk mitigation measures, maintain record of activities carried out on their platform, report suspicious transactions and implement targeted financial sanctions and the "travel rule". In the interest of client asset protection and investor safety, it is recommended that jurisdictions implement IOSCO's Policy Recommendations for Crypto and Digital Asset Markets.

Apart from these recommendations, targeted restrictions could be justified to manage specific risks for resource-constrained authorities as part of their larger policy response.

### The IMF-FSB Synthesis Paper (5/5)

### Part 3: Implementation Roadmap

The includes synthesis paper an implementation roadmap (Annexure 3) which the covers implementation recommendations laid down by the IMF, the FSB, FATF, IOSCO, and other standard setting bodies along with the proposed timelines and responsible bodies for execution, which will also require coordinated support from jurisdictional authorities and international cooperation. Some key elements of this roadmap include:

i. Global Regulation: Promotion of FSB's highlevel recommendations following their G20 endorsement

ii. Risk Assessment: Continuous assessment of macroeconomic risks and implications by the IMF

iii. Consumer Protection: Establishment of a board-level Fintech Taskforce (FTF) to oversee and implement IOSCO's regulatory agenda; the FTF, through its DeFi workstream, will consult on proposed DeFi recommendations

iv. Banking Standards: Implementation of the global prudential standard for banks' exposures to VDAs endorsed by the Group of Central Bank Governors and Heads of Supervision

v. Supervision and Oversight: Incorporation of the FSB and other SSB Standards and Guidance in its surveillance program

vi. Training Programs: Execution of capacity building programs to be undertaken by the IMF

Apart from these measures, long term goals of the roadmap also include outreach efforts by the IMF and FSB to engage with countries outside the G20 group and minimisation of data gaps through projects such as the Data Gaps Initiative-3 (DGI-3). The execution timelines cover the next 3 years as multiple initiatives will be undertaken until the end of 2025.

# Drife taking on Ola and Uber with Blockchain Technology

- Lack of available cabs, ride cancellations, and price surges are making ride-hailing services increasingly difficult to use in Indian metros.
- Entrepreneur Firdosh Sheikh believes leveraging blockchain technology to tackle the existing challenges is the best way forward.
- With the Bengaluru-based blockchain project Drife (founded in 2021), Firdosh and cofounders Surya Ranjith and Mudit Marda are building a ride-hailing experience with zero commission taken from drivers, marketdictated pricing, open governance, and transparency.
- An early-stage project, Drife is live in Bengaluru, with the maximum concentration of its blue-and-white cabs at the Kempegowda International Airport.
- The startup completes around 1,000 rides per week and the rides can be booked on its Android and iOS app.

# Apollo Hospitals Group to foray into metaverse

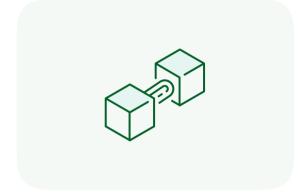

- Healthcare major Apollo Hospitals Group, announced its collaboration with Californiabased deep tech start-up, 8chili Inc, to enable patient engagement in the metaverse.
- A first-of-its-kind initiative in the healthcare industry, the collaboration will enable pre/ post-operation patient counseling through virtual reality (VR), enabling increased patient engagement as well as providing skill mastery for hands-on training to the healthcare workers.
- In a virtual press conference to announce the collaboration, Prathap C Reddy, Chairman, Apollo Hospitals Group, said patient expectations continue to increase and to provide them with best possible care, healthcare providers should keep adopting to emerging technologies.
- Using 8chili's HintVR platform, Apollo Hospitals can engage the users (patients) in virtual reality-mediated activities to empower their abilities to regulate emotion.
- This personalized approach to every patient will help result in higher patient satisfaction.

# Glossary

### Simplifying The Web3 World

### **Blockchain Bridge**

A blockchain bridge is a mechanism that enables the transfer of assets or data between two different blockchain networks. It acts as a link or connector, allowing interoperability between otherwise separate and independent blockchains.

Bridges can operate in various ways, but they typically involve a set of smart contracts or protocols that lock up assets on one blockchain while issuing equivalent assets on the target blockchain. Once the assets are transferred, the bridge unlocks the corresponding assets on the original blockchain.

Blockchain bridges play a vital role in achieving greater functionality and utility in the decentralized ecosystem, as they facilitate cross-chain interactions and expand the potential use cases for blockchain technology.

### **Altcoin**

An altcoin, short for "alternative coin," essentially refers to any digital or virtual currency that is not Bitcoin.

Some popular examples of altcoins include Ethereum, Ripple (XRP), Litecoin, and Cardano. Each altcoin typically operates on its own blockchain or a modified version of an existing one, and they may offer different features, such as smart contracts, faster transaction speeds, or enhanced privacy features.

Investors and users may choose to engage with altcoins for a variety of reasons, including potential for higher returns on investment, interest in specific technological innovations, or a desire to support projects with unique use cases. It's important to note that the altcoin market is highly diverse and dynamic, with new coins and projects regularly emerging.

# Glossary

### Simplifying The Web3 World

### **Centralised VDA Exchanges**

A Centralized Virtual Asset Exchange (VDA) refers to a digital platform where individuals or entities can buy, sell, and trade virtual assets using a centralized authority to facilitate transactions.

The exchange is controlled and managed by a central entity or organization which oversees the operations, sets rules, and often holds custody of users' assets. A centralized exchange requires a level of trust in the exchange's security and management practices.

Centralized exchanges often have high trading volumes, providing liquidity for traders. This means there are usually enough buyers and sellers to ensure smooth trading. Some centralized exchanges allow users to trade between tokens and fiat currencies.

### **Decentralised VDA Exchanges**

A Decentralized Virtual Asset Exchange (VDA) is a digital platform that enables individuals to buy, sell, and trade virtual assets without the need for a centralized intermediary or authority. In a decentralized exchange (DEX), users retain control of their funds and execute transactions directly from their wallets.

Users interact directly with one another to conduct trades, without relying on a central authority to facilitate or oversee the process. DEXs employ smart contracts to automate the process of order matching and settlement, ensuring that trades are executed in a secure and transparent manner. These platforms play a vital role in the decentralized finance (DeFi) ecosystem, offering users greater control and flexibility over their virtual asset transactions.
